! This is an example report used for teaching purposes

This is an example report used to help students understand how different types of report can be created using the Quarto markup language and the R programming language. **The contents of this report should not be relied upon for operational use.**

This report identifies the parts of the City of Yarra that had the highest volume of illegal waste dumping in 2018. Incidents are recorded by the city authorities if the incidents are reported to them by other agencies or directly by members of the public. It is likely that the number of recorded incidents underestimates the actual number of incidents that occur, since not all land owners will report to the City authorities and some dumping may occur on land without a clear owner or manager who might report it.

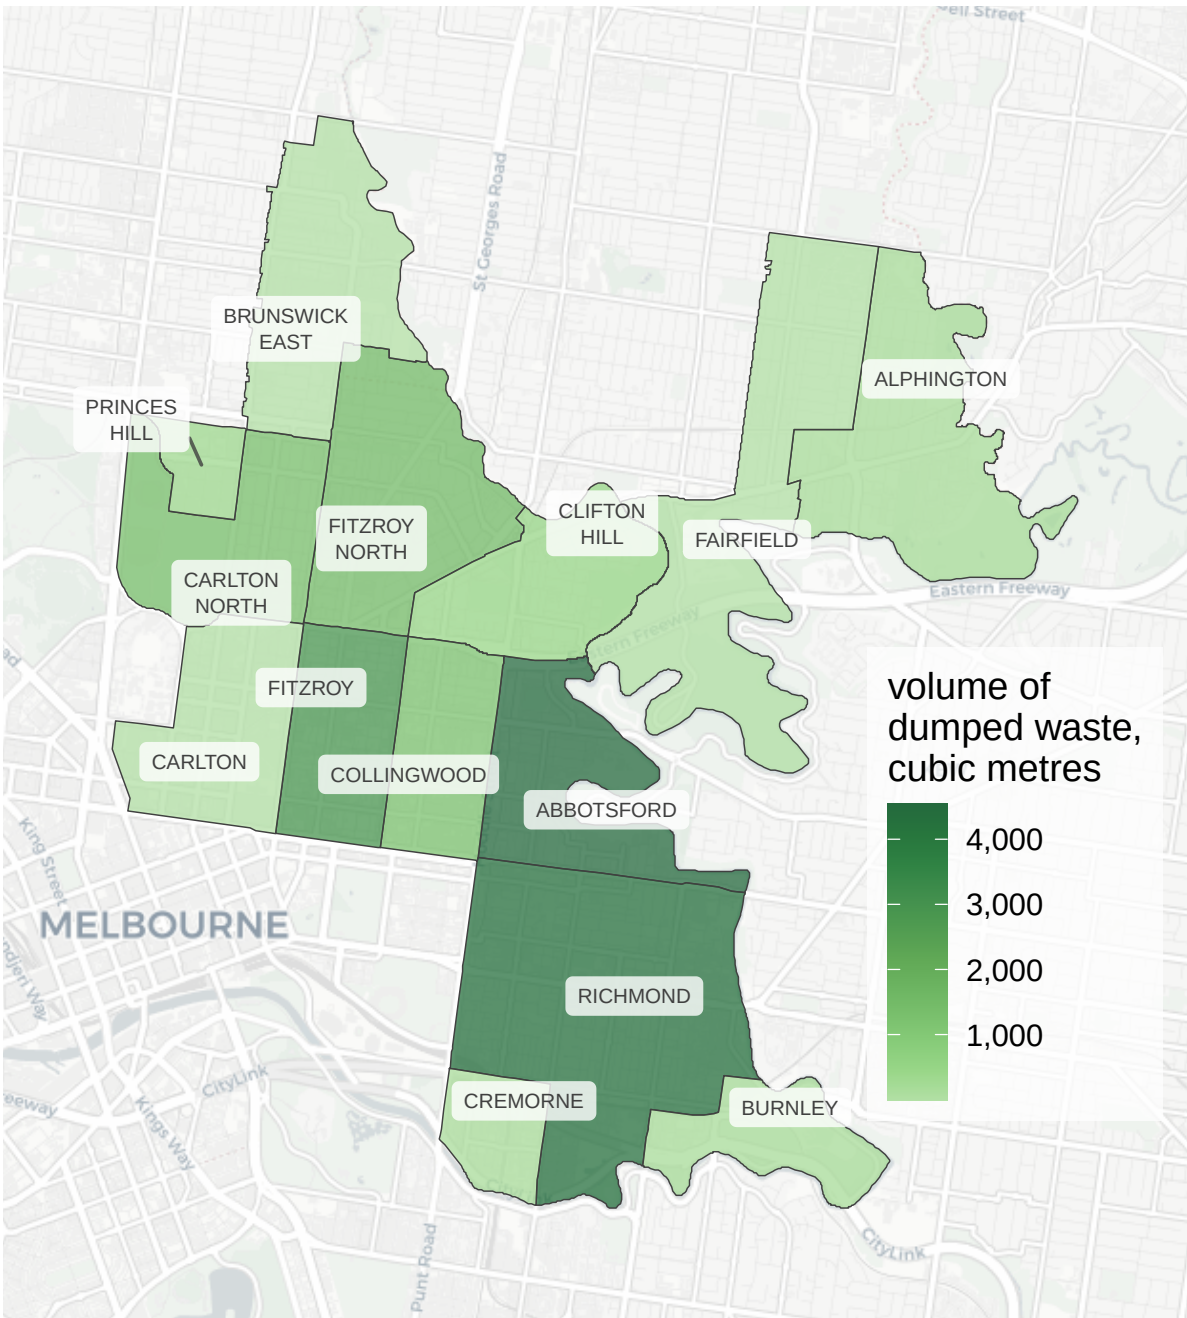

In 2018 there were 10,357 incidents of illegal dumping of waste in Yarra, with 17,206 cubic metres of waste being reported as dumped. The population of Yarra is approximately 91,500, indicating that in 2018 there was one reported dumping of illegal waste for every 8.8 residents.

The typical incident involved only a small quantity of waste, with half of reported incidents involving 1 cubic metre of waste or less and no incidents involving more than 5 cubic metres of waste.

Figure 1 shows the overall volume of illegal waste dumped in each suburb of Yarra in 2018. The 3 suburbs with the highest volume of illegal waste dumping (out of the 14 suburbs in the city) accounted for 68% of all reported illegal dumping in Yarra. Those suburbs were Abbotsford (26% of all the waste dumped in Yarra), Richmond (25%) and Fitzroy (17%).

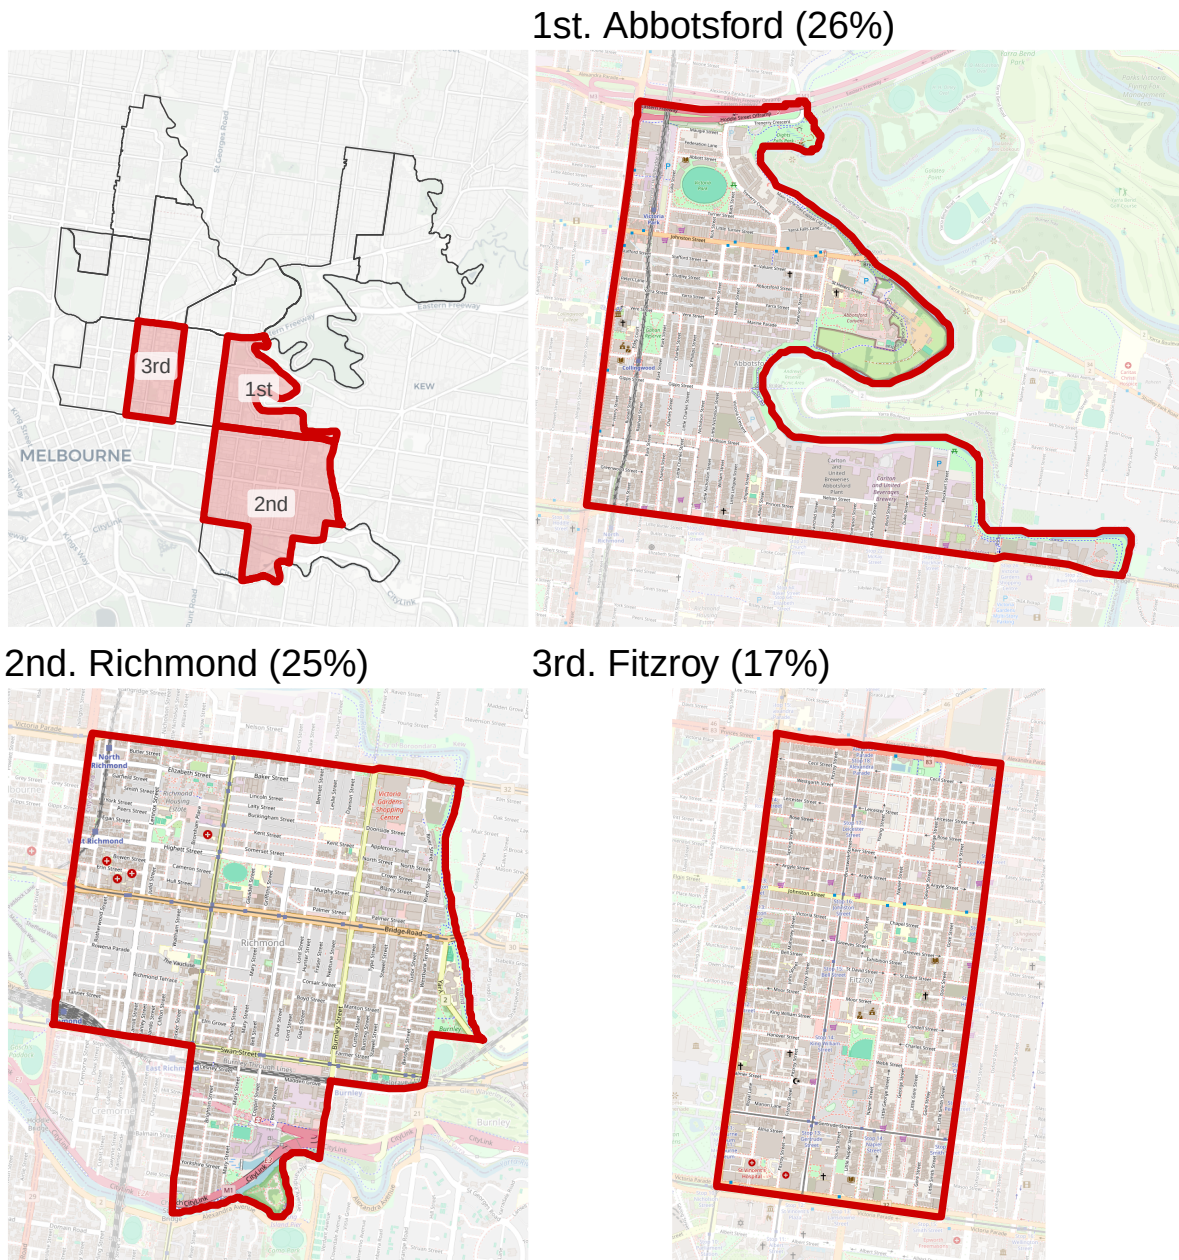

It is not possible with the available data to identify where within each suburb dumping incidents were most concentrated. Further analysis would be necessary to identify the streets or open spaces with most incidents, but Figure 2 shows the boundaries of the three suburbs that had the highest volume of dumped waste.

Each panel in Figure 3 has its own colour scale, so compare the numeric legends rather than shades between panels.

Dumped waste was categorised into several types: general waste (73%), multiple waste types (10%), furniture (8%), green waste & soils (5%), mattress (2%) and other (2%). There was some variation in where different types of waste were dumped. Figure 3 shows the volume of waste of each main type that were reported as being dumped in each suburb. For example, while the suburb of Richmond had the highest volume of dumping of general waste, Abbotsford had the highest volume of dumping that involved multiple waste types.
